READ THIS FIRST

This document describes a product under active development. Features marked as roadmap are not yet built. Statements about future performance are intentions, not commitments. Section 10 sets out the risks in full and should be read before participating in any round.

SECTION 01

Summary.

PowerX OneWallet is a self-custodial Web3 super-wallet. It combines the things people currently need four or five separate apps to do: holding crypto, swapping it, earning on it, talking to people, broadcasting to an audience, and getting paid by that audience. All of it in a single application where the user holds their own keys throughout.

PX1 is the currency of that ecosystem. It is a BEP-20 token on BNB Chain with a fixed supply of 100,000,000,000. There is no inflation and no mint function beyond the fixed supply.

The wallet, the live-room product (PowerX Call), on-chain user profiles and the core backend are built and running today. The token generation event, exchange listing and the wider social and financial layers follow on the roadmap set out in Section 08.

What separates PX1 from a utility token bolted onto an app is that the platform's economics point back at the people holding it: 80% of net platform profit is directed to a holder pool claimable by staking, governance is on-chain, and 1% of every swap is permanently removed from supply.

FOUNDER ROUND

Closed

Fully sold at $0.0001. $1,000,000 raised.

PUBLIC ROUND

Open

$0.0002 per PX1. $5 minimum, $25,000 cap per wallet.

LISTING TARGET

$0.0004

A target, not a guarantee. Market price is set by the market.

In one line

A wallet you actually own, a social and creator layer that pays out directly, a token that captures the value of both, and a real-world business you can spend it in.

SECTION 02

Three problems, one root cause.

Three things are wrong with how people hold value and build an audience online, and they compound each other.

Custody

Most people who own crypto do not hold it. They hold an IOU issued by an exchange. Every major failure of the last decade, from Mt. Gox to FTX, has been a custody failure rather than a technology failure. The chains kept working. The custodians did not.

Take rates

A creator on a mainstream platform surrenders 30% to 50% of gross revenue before anything reaches them, waits weeks or months for settlement, and can be demonetised without appeal or explanation. The infrastructure they built their livelihood on is rented, and the rent is set by someone else.

Distribution

Reach is allocated by algorithms that optimise for platform engagement, not for the relationship between a creator and the people who chose to follow them. An audience someone spent years building can be switched off overnight by a ranking change they were never told about.

Each of these has been attacked separately. Self-custodial wallets solve custody but have no social layer. Creator platforms solve payments but hold the money and the audience. Decentralised social protocols solve distribution but are difficult to use and have no working payment rail.

THE ROOT CAUSE

PowerX addresses all three in one application, because in practice they are one problem: **the user does not own their money, their income, or their audience.**

SECTION 03 · BUILT AND RUNNING

What exists today.

Self-custodial wallet LIVE

Keys are generated on the device and never leave it. PowerX cannot access, freeze, or move user funds, and cannot restore an account. This is a deliberate trade-off: absolute user control in exchange for absolute user responsibility.

The identity model is deliberately simple. One seed phrase maps to one username. There is no raw private-key import and no multi-account confusion. The thing a user backs up is the thing that restores everything. Users set their own receiving address, so payments arrive at a human-readable name rather than a hex string.

PowerX Call LIVE

Live audio and video rooms with a payment rail built in. A host can gate a room, charge for entry, and receive payment directly in PX1, settled on-chain, wallet to wallet, without an intermediary holding the money in between.

This is the clearest expression of what the wallet is for. The room is the product, PX1 is the ticket, and the settlement is instant.

On-chain profiles LIVE

A user profile tied to the wallet rather than to a platform database. It travels with the keys. It is not a record PowerX can delete.

Core infrastructure LIVE

The backend, security layer and node infrastructure that everything above runs on.

SECTION 03 · ON THE ROADMAP

What comes next.

Social feed

Chronological and follow-based. No engagement-ranked ordering, no injected recommendations, no algorithmic suppression. If someone follows an account, they see what it posts.

This is a product position rather than a technical one: reach should be a consequence of the relationship a creator built, not a variable the platform tunes.

P2P decentralised chat

Direct and group messaging, end-to-end encrypted, addressed to wallets rather than phone numbers or platform accounts.

Swap, farming and staking

Token swaps inside the wallet, with 1% of every swap permanently burnt. Staking and liquidity farming, which are also the mechanism through which the community allocation reaches holders.

Creator monetisation

Tipping, premium subscriptions and paid rooms, all settled directly in PX1 from supporter to creator. The platform's cut is a fraction of what mainstream platforms charge, and settlement is immediate rather than on a monthly payout cycle.

PowerX Music

Artists host their own audio, retain ownership on-chain, and receive payment directly from listeners on a 95/5 split in the artist's favour. Streaming today pays fractions of a cent per play through a chain of intermediaries. The direct model changes the shape of the relationship rather than just the percentage.

SECTION 04

The token.

Name	PX1
Chain	BNB Chain
Standard	BEP-20
Total supply	100,000,000,000
Inflation	None
Issuer	Origen Naturals Co. Ltd

What PX1 is for

PX1 is the unit of account across the platform. Demand is a function of activity rather than of speculation alone. Every paid room, tip, subscription and swap requires the token.

- **Room entry:** paid access to PowerX Call rooms
- **Tips:** direct supporter-to-creator payments
- **Subscriptions:** recurring creator revenue
- **Music:** listener-to-artist payments
- **Swap fees:** trading inside the wallet
- **Staking and farming:** earning on held balances
- **Governance:** voting on treasury and protocol decisions

Burn

1% of every swap inside the wallet is burnt, sent to an address from which it cannot be recovered. Supply only ever moves in one direction.

Where value accrues

01
Utility demand
Platform activity requires PX1.

02
Supply reduction
Swap volume permanently burns supply.

03
Revenue share
80% of net profit to the holder pool.

SECTION 05 · ALLOCATION

100 billion, fixed forever.

ALLOCATION	%	TOKENS
Community staking & farming rewards	65%	65,000,000,000
Founder round	10%	10,000,000,000
Public round	10%	10,000,000,000
Treasury, DAO-governed	10%	10,000,000,000
Team	2.5%	2,500,000,000
Advisory	2.5%	2,500,000,000
Total	**100%**	**100,000,000,000**

Two thirds of the entire supply goes to users, earned through staking and farming rather than distributed by decision. Team and advisory together hold 5%, deliberately small, and locked longer than any other allocation.

> WHY THIS SHAPE
>
> The two allocations that most projects inflate, team and insiders, are the two smallest here. The largest is the one nobody controls: 65% is earned by users, not granted to them.

SECTION 05 · ROUNDS

Rounds and pricing.

ROUND	PRICE PER PX1	STATUS
Founder round	$0.0001	Closed, fully sold
Public round	$0.0002	Open
Listing target	$0.0004	At TGE

IMPORTANT

The listing figure is a target, not a guarantee. Market price at listing is determined by the market.

Founder round

Closed. The full 10% allocation sold at $0.0001, raising **$1,000,000**.

Public round OPEN

MINIMUM

$5

Deliberately low. Participation should not require size.

MAXIMUM

$25,000

Per wallet. A cap favours holder count over concentration.

Payment: USDT on Ethereum, BNB Chain or Tron. Allocation is recorded on-chain against your address.

Send only from a wallet you control, never from an exchange account.

How to take part

1. Pick your network and the amount of USDT you want to spend.
2. Open the dashboard. Your amount carries over.
3. Connect your wallet. PowerX never holds your keys or your funds.
4. Send USDT and confirm in your wallet.
5. Track your unlock. Locks start at TGE.

SECTION 05 · VESTING

Locks and unlocks.

All lock periods begin at the token generation event, not at the time of purchase.

FOUNDER & PUBLIC ROUNDS

6-month cliff, then 10% monthly

Nothing unlocks for six months after TGE. From month seven, 10% releases each month across ten months. Fully unlocked at month sixteen.

TEAM & ADVISORY

12-month cliff, then 24 months

Nothing unlocks for twelve months after TGE, then monthly release across the following twenty-four. Fully unlocked at month thirty-six.

THE ORDER MATTERS

Team and advisory are locked more than twice as long as the people who funded the project. Insiders exit last.

Rights during the lock

Voting rights and revenue share apply from day one. Holders are not required to wait for unlock to participate in governance or to claim from the revenue pool. The lock restricts transfer, not participation.

Known unlock pressure

From month seven after TGE, round allocations begin unlocking at 10% per month. This is predictable, disclosed, and should be factored into any assessment of the token. It is set out again in the risk factors in Section 10.

SECTION 05 · THE 65%

Earned, not granted.

The community allocation is 65 billion PX1. It is the largest single number in this document, and the one most projects use as a discretionary reserve.

It is not airdropped. It is not granted. It is not held back for deals. It is released **exclusively as staking and farming rewards**, earned by users who stake PX1 or provide liquidity.

The structure means no individual and no committee decides where it goes. It is earned, at a rate set by protocol parameters, by whoever participates.

Emission parameters are set and adjusted by on-chain governance. All emissions are drawn from the fixed 100 billion supply. This is a distribution schedule, not inflation. No tokens are created beyond the fixed cap.

Treasury: 10%

DAO-governed. At launch the treasury's use is restricted to two purposes:

- Initial exchange liquidity
- The launch airdrop

Any further deployment requires a governance vote. The treasury is not a discretionary fund.

SECTION 06

80% of profit, back to holders.

TO THE HOLDER POOL

80%

Of net platform profit, claimable by staking.

RETAINED

20%

Operations, development and buybacks.

Net profit is calculated after operating costs. The pool is funded from real platform revenue: room fees, subscriptions, swap fees, creator platform fees, and in time merchant and real-world asset revenue.

Stake to claim

The pool is not distributed automatically. Holders claim from it by staking their PX1.

This is a deliberate design choice, and it is worth being explicit about why. An automatic pro-rata distribution to every holder, payment for doing nothing purely by virtue of holding, closely resembles a dividend and carries regulatory implications in a number of jurisdictions. Requiring an active staking action changes both the legal character and the incentive structure: it rewards participation rather than passive holding, and it removes tokens from circulation while staked.

TERMINOLOGY

Throughout this document the mechanism is described as **revenue share**, not as a dividend, and it should be understood as such.

SECTION 06 · BOOST AND GOVERNANCE

Early backers, permanent voice.

Revenue share boost

FOUNDER ROUND

+20%

Enhanced share rate during vesting.

PUBLIC ROUND

+10%

Enhanced share rate during vesting.

The boost applies during the vesting period and **ends at full unlock**. It compensates early backers for capital locked while others trade freely, and it expires when that asymmetry expires.

Governance

All holders vote. Voting is on-chain. Governance covers treasury deployment, emission parameters, fee structures and protocol changes.

FOUNDER VOTING WEIGHT

Founder round participants hold 5× voting weight. This is permanent and wallet-bound. It attaches to the wallet that participated in the round and does not transfer with the tokens if they are sold. It cannot be bought on the open market at any price.

The design intent is that the people who funded the project before it had a market keep a durable voice in its direction, and that this voice cannot be accumulated later by anyone with enough capital.

SECTION 07

A token you can spend.

Most tokens are claims on software. PX1 is intended to be spendable on physical and services, and PowerX is building the first of those businesses itself rather than waiting for third parties to adopt it.

PowerX One Coffee

A coffee chain, funded in part by this raise, where PX1 will be accepted as payment from the first day of trading.

BE CLEAR ABOUT THIS

This business does not yet exist. No location is open. The raise funds the first one. Anything shown in marketing material relating to it is a concept render, labelled as such.

The intent is a first location followed by a franchise model, positioning PX1 as a currency someone can actually spend rather than only trade.

Merchant payments

A payment rail allowing independent merchants to accept PX1 directly, settled wallet to wallet.

PowerX card

A crypto card enabling PX1 balances to be spent through conventional payment networks. Architecturally this will be built on smart accounts, preserving self-custody. PowerX will not at any stage take custody of user funds in order to issue a card.

SECTION 08 · NO DATES

Phases advance when the work is finished.

Phase 01 · Foundation

LIVE

The wallet, the rooms and the identity layer, built and running.

- Founder round, closed
- Self-custodial wallet MVP, live
- PowerX Call MVP, live rooms and video, live
- User profiles and on-chain identity, live
- Core backend and infrastructure, live

Phase 02 · Launch

NOW

Audited, listed, and open to everyone.

- Public pre-sale round, live
- iOS and Android open testing, live
- CertiK security audit, in progress
- P2P decentralised chat MVP
- PowerX Call payments
- Swap, farming and staking
- PowerX One airdrop
- TGE and DEX listing
- iOS and Android public release

SECTION 08 · AHEAD

Ecosystem, then scale.

Phase 03 · Ecosystem

NEXT

Creators earn, holders share the upside, and the first real-world asset opens.

- Social feed, algorithm-free
- Creator tipping
- Premium subscriptions
- Community groups and forums
- Fiat on-ramp
- PowerX Music MVP
- CEX listing
- Holder revenue share pool, stake to claim
- On-chain governance voting
- PowerX One Coffee: first location

Phase 04 · Global scale

HORIZON

PX1 leaves the app and enters the real world.

- Merchant payments
- PowerX crypto card
- PowerX One News and Gaming
- Marketplace
- Strategic partnerships
- International scaling

SECTION 09

Security.

Custody model

Keys are generated on-device and never transmitted. PowerX holds no user funds at any point and has no technical ability to access, freeze or recover them.

THE CONSEQUENCE

A lost seed phrase means permanently lost funds. There is no support process that can reverse this, because there is no privileged access for support to use. Users should understand this before depositing anything.

Identity design

One seed phrase corresponds to one username. Raw private-key import has been eliminated, removing a well-documented category of user error and phishing. Account recovery is the seed phrase and nothing else.

Audit IN PROGRESS

A security audit by CertiK is in progress. The full report will be published on completion.

The audit is **not yet complete**, and no claim is made in this document that the platform is audited. That status will be updated when the report is delivered.

Contract

The PX1 contract will be published and verified on BscScan at the token generation event.

SECTION 10

What PX1 is, and is not.

Issuer

PX1 is issued by Origen Naturals Company Limited.

Nature of the token

PX1 is a utility token. It is the medium of exchange within the PowerX ecosystem. It does not represent equity in Origen Naturals Company Limited, does not confer ownership of the company, and does not entitle holders to a share of company assets on winding up.

The revenue share described in Section 06 is a platform mechanism claimable through staking. It is not a dividend and should not be understood as one.

Risk factors

Anyone considering participation should weigh the following.

- **Total loss.** The value of PX1 may fall to zero. Only capital that can be entirely lost should be committed.
- **Pre-revenue.** PowerX does not currently generate meaningful platform revenue. The revenue share mechanism depends on the platform becoming profitable, which is not guaranteed. Any revenue figures shown in supporting materials are illustrative projections rather than results.
- **Illiquidity during lock.** Round participants cannot sell for at least six months after TGE and are not fully unlocked for sixteen months. Market conditions may change substantially during that period.
- **Listing price.** The $0.0004 figure is a target. Listing price is set by the market and may be lower.

SECTION 10 · RISK FACTORS CONTINUED

Read this part carefully.

- **Unlock pressure.** From month seven after TGE, round allocations begin unlocking at 10% per month. This is a known and predictable source of sell pressure.
- **Execution.** Most of the roadmap is unbuilt. Delivery depends on development execution, funding and market conditions.
- **Real-world assets.** PowerX One Coffee does not exist. Physical retail carries operational risk entirely separate from the platform.
- **Regulation.** Digital asset regulation is unsettled and varies by jurisdiction. Rule changes could materially affect the token, the platform, or a holder's ability to use either.
- **Smart contract risk.** Audits reduce risk. They do not eliminate it.
- **Concentration.** Early rounds and the treasury represent meaningful supply concentrations.
- **Self-custody.** A lost seed phrase means permanently lost funds, with no recovery mechanism of any kind.

Not advice

Nothing in this document is investment, financial, legal or tax advice. It is not an offer or solicitation in any jurisdiction where such an offer would be unlawful.

Participants are responsible for their own compliance with local law, and should take independent professional advice before participating.

FORWARD-LOOKING STATEMENTS

This document describes a product under active development. Features marked as roadmap are not yet built. Statements about future performance are intentions, not commitments.

SECTION 11

Questions, answered.

What is PX1?
The currency of the PowerX ecosystem. Room entry, tips, subscriptions, swaps and payouts are all priced in it. Supply is fixed at 100 billion with no inflation and no hidden mint, and 1% of every swap is burnt on-chain permanently.

Which chain is it on?
BNB Chain, as a BEP-20 token.

How do I take part in the public round?
$0.0002 per PX1, paid in USDT on Ethereum, BNB Chain or Tron. Minimum $5, maximum $25,000 per wallet.

When can I sell?
Locks begin at TGE: six months of no unlock, then 10% per month over ten months. Full unlock at month sixteen.

Do I get anything during the lock?
Yes. Voting rights and revenue share apply from day one. Public round participants also receive a 10% share boost, which ends at full unlock.

Does PowerX hold my funds?
No. Keys are generated on your device and never leave it. PowerX cannot access, freeze or recover them, which also means a lost seed phrase means lost funds.

Is the platform audited?
A CertiK audit is in progress. The report will be published on completion. It is not finished yet.

SECTION 11 · CONTINUED

More questions.

What is the treasury for?

Initial liquidity and the launch airdrop. Anything beyond that requires a governance vote.

Where does the 65% community allocation go?

Entirely to staking and farming rewards, earned by users. It is not held in reserve and not distributed at anyone's discretion.

Why is the revenue share claimed by staking rather than paid automatically?

An automatic distribution to passive holders closely resembles a dividend and carries regulatory implications in several jurisdictions. Staking to claim rewards participation rather than passive holding, and removes tokens from circulation while staked.

What is the 5× founder voting weight?

Founder round participants hold five times the voting weight of other holders. It is permanent and bound to the wallet that participated. It does not transfer with the tokens and cannot be bought on the open market.

Is there a team page?

PowerX is structured to be DAO-governed. Governance sits with token holders rather than with a named leadership team, and the treasury is controlled by vote.

Does PowerX One Coffee exist?

Not yet. The raise funds the first location. All imagery relating to it is concept work.

Where is the contract address?

It will be published and verified on BscScan at the token generation event.

How do I get in touch?

Social@powerx.one

Own your money. Own your audience.

The wallet is live. The rooms are live. The public round is open at $0.0002 per PX1.
